

Disinfection Dysfunction?

Safety Indifference Syndrome

Some disinfectants may pose a health risk to users, patients and the environment. Using a disinfectant with a preferred safety profile will increase user compliance.

Dwell Time Disease

Many disinfectants evaporate before achieving disinfection. Using disinfectants that stay wet for the required contact time will increase product compliance.

Label Deficit Disorder

Some disinfectants have labels that are ambiguous. Due diligence is required to effectively select disinfectants to meet regulatory compliance.

Cross Contamination Conundrum

Some disinfectants can transfer pathogens from surface to surface during the disinfection process. Disinfectants that inhibit cross contamination prevent outbreaks and aid in protocol compliance.
